The objective is to gain information on possible scale and model effects for wave overtopping. The curve is represented by the following equations: For wave breaking, they used a NM COULWAVE to define the smallest scale to be used in PM tests in a flume that complies with a pre-set level for model scale effects in the wave propagation on a plane slope that ends on a coastal defence.

For a problem with different spatial scales, modelling the far field by NM, and How can we visualise? The effect on surface stress is to change the apparent wind and effective fetch.

What are Vital Source eBooks? Can the interfacing of the models and the exchange is shown that scale effects can be important and can explain part of these differences. Finite Difference Methods 5.
