East Dane Designer Men's Fashion. Either single diagonals are provided, as shown, in which case they must be designed for either tension or compression, or crossed diagonals are provided, in which case slender bracing members carrying only tension may be provided. Forces in the individual members of the bracing system must be determined for the appropriate combinations of actions.

Heavy gauges, such as 12 and 14 gauge, are commonly used when axial loads parallel the column axis. At roof level, bracing, often known as a wind girder, may be required to carry the horizontal forces at the top of the columns, if there is no diaphragm. Withoutabox Submit to Film Festivals. Where the sets of bracing are identical or similar, it is sufficient to assume that the horizontal forces wind loads and equivalent horizontal forces, each magnified for second order effects if necessary, see discussion below are shared equally between the bracing systems in the orthogonal direction under consideration.

It is much easier to use equivalent horizontal forces than to introduce the equivalent horizontal forces into the bracing in a multi-storey building.
