I'm sure whoever originally found those aim points out spent a lot of time doing it. If there are already publicised posts on the topic we may remove separate threads which do not contribute new information. This was done twice, at two different events to prove repeatability.

Letmeknowifyouhaveanyfeedback! Semi-empirical aeroprediction models have been developed that reduced extensive test range data on a wide variety of projectile shapes, normalizing dimensional input geometries to calibers; accounting for nose length and radius, body length, and boattail size, and allowing the full set of 6-dof aerodynamic coefficients to be estimated. This behavior was observed As the Bullets Drop most of the measured small calibre bullets, and not so much for the larger calibre bullets. Why does it drop fast the first m, then straighter, and finally dropping again? Projectiledropdoesnotdescribetheactualtrajectoryoftheprojectile.T
